Aconcagua

location: Argentina, South America
height: 22,841 feet

first climbed: 1897, Edward Fitzgerald

notes:

The northern approach to Aconcagua is easy from a mountaineering standpoint, although the effects of altitude are still present. In fact, the routes up the mountain are fairly well developed; base camps exist with shower facilities and other amenities.

This part of the Andes mountain range is the result of the Nacza plate interacting with the South American plate. However, Aconcagua is not a volcano.
