## Problem Set 5

Due: Tuesday, October 23

Problem 1. Prove by induction on the number of faces that a plane graph $G$ is bipartite if and only if every face has even length.

Problem 2. Prove that every $n$-vertex plane graph isomorphic to its dual has $2 n-2$ edges. For all $n \geq 4$, construct a simple $n$-vertex plane graph isomorphic to its dual.

Problem 3. Prove that every simple planar graph with at least four vertices has at least four vertices with degree less than 6 . Construct a simple planar graph $G$ with 8 vertices that has exactly four vertices with degree less than 6 .

Problem 4. Prove that if $G$ is a color-critical graph, then the graph $G^{\prime}$ generated from it by applying Mycielski's construction is also color-critical (color-critical means $k$-critical for some $k$ ).

Problem 5. A triangulation is a simple plane graph where every face boundary is a 3 -cycle. Prove that a triangulation is 3 -colorable if and only if it is Eulerian. (Hint: Color the faces of $G$.)
