

# *Search for exotic Baryons at HERMES*

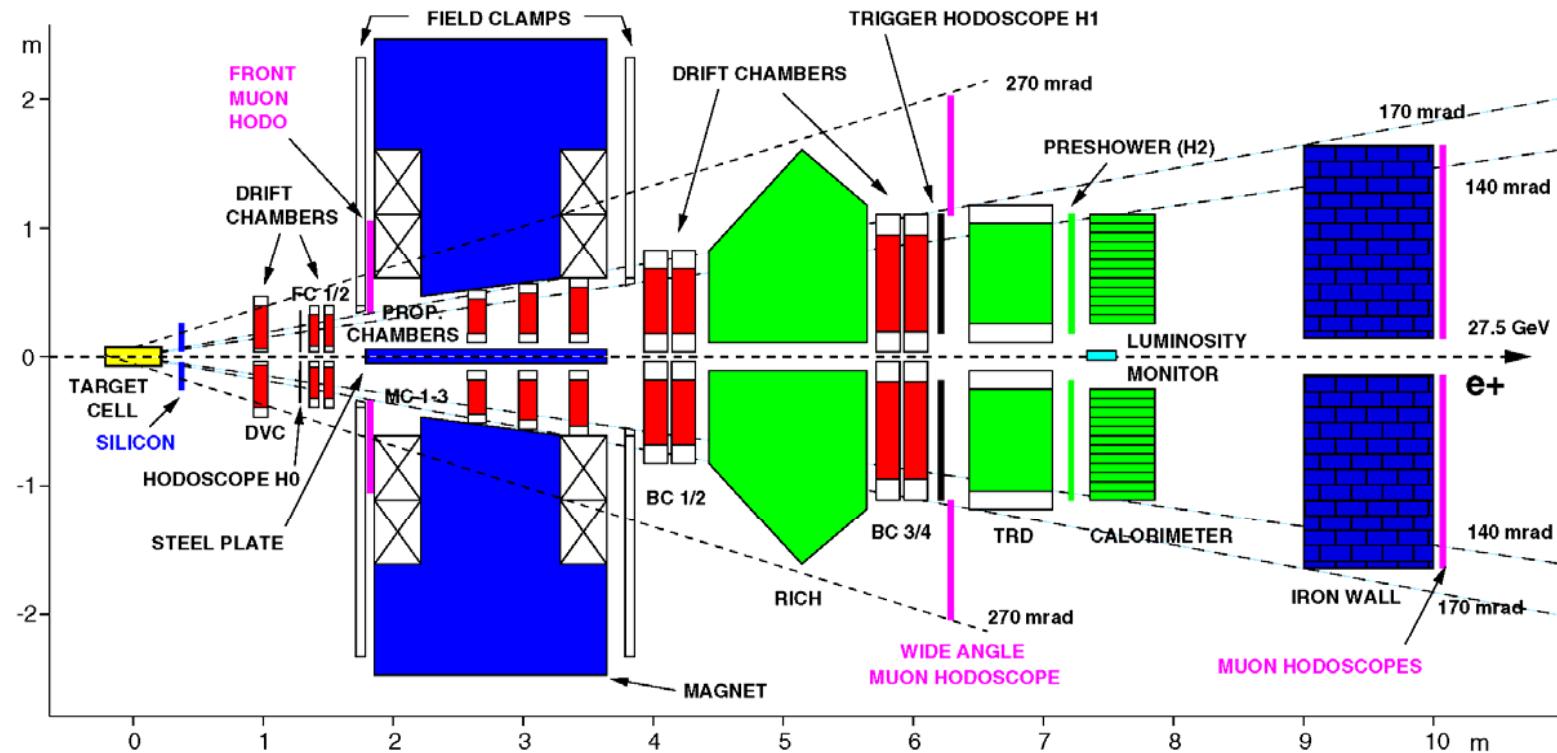

*Wolfgang Lorenzon (MUNIVERSITY OF MICHIGAN)*  
*on behalf of the HERMES Collaboration*

W. Lorenzon

Pentaquark05 – Oct 2005

# The HERMES Spectrometer

Beam: 27.6 GeV  $e^+/e^-$  from HERA accelerator

Track reconstruction:  $\Delta p/p < 2\%$ ,  $\Delta\theta < 0.6$  mrad

Particle ID: TRD, Preshower, Calorimeter (hadron/lepton sep.)  
dual radiator RICH ( $\pi, K, p$  separation)

W. Lorenzon

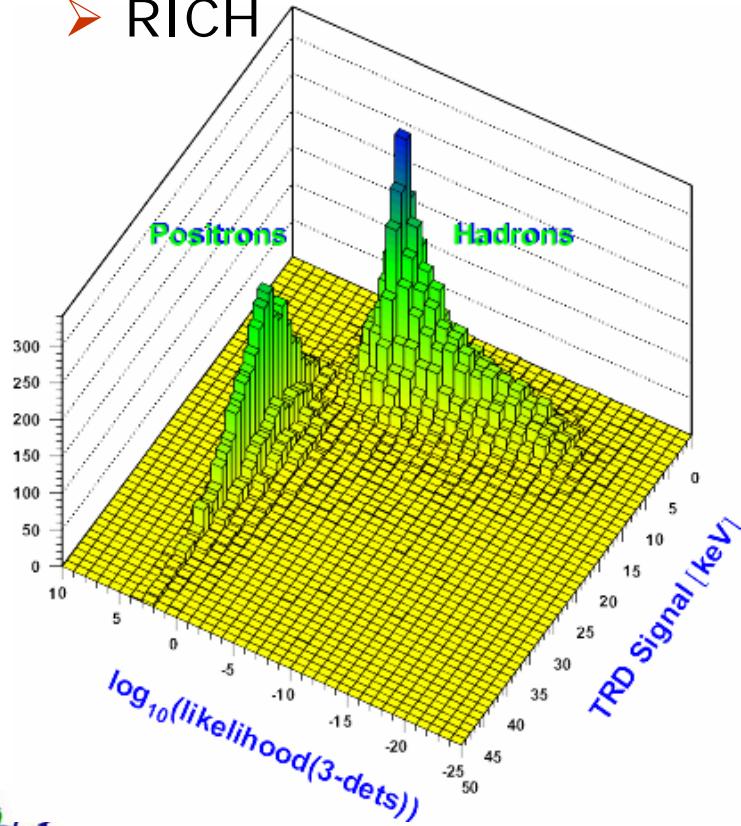

Pentaquark05 – Oct 2005

# Particle Identification

## hadron/lepton separation

Combination of:

- TRD
- calorimeter
- preshower
- RICH

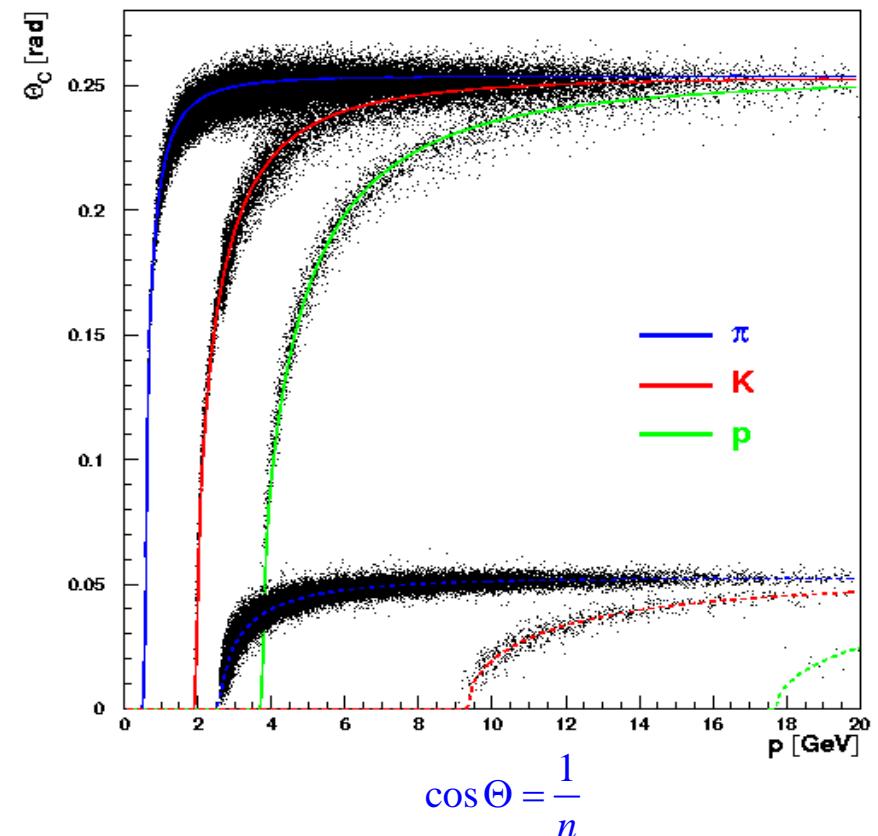

W. Lorenzon

## hadron identification

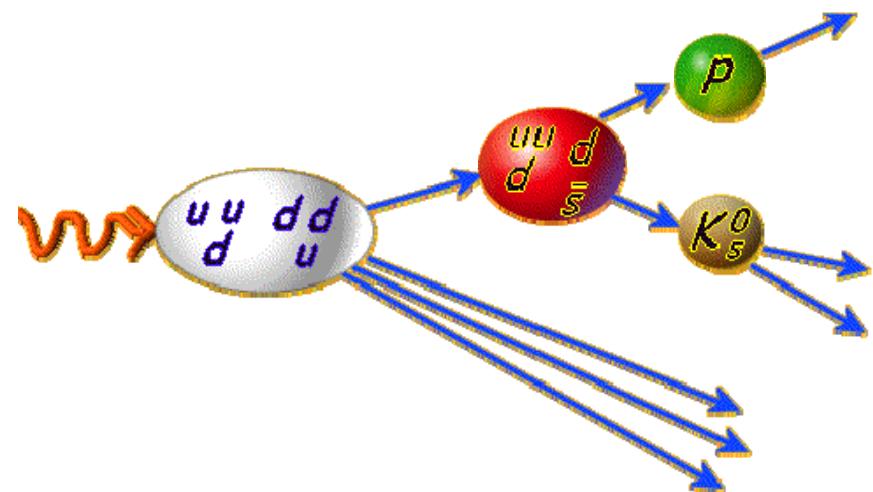

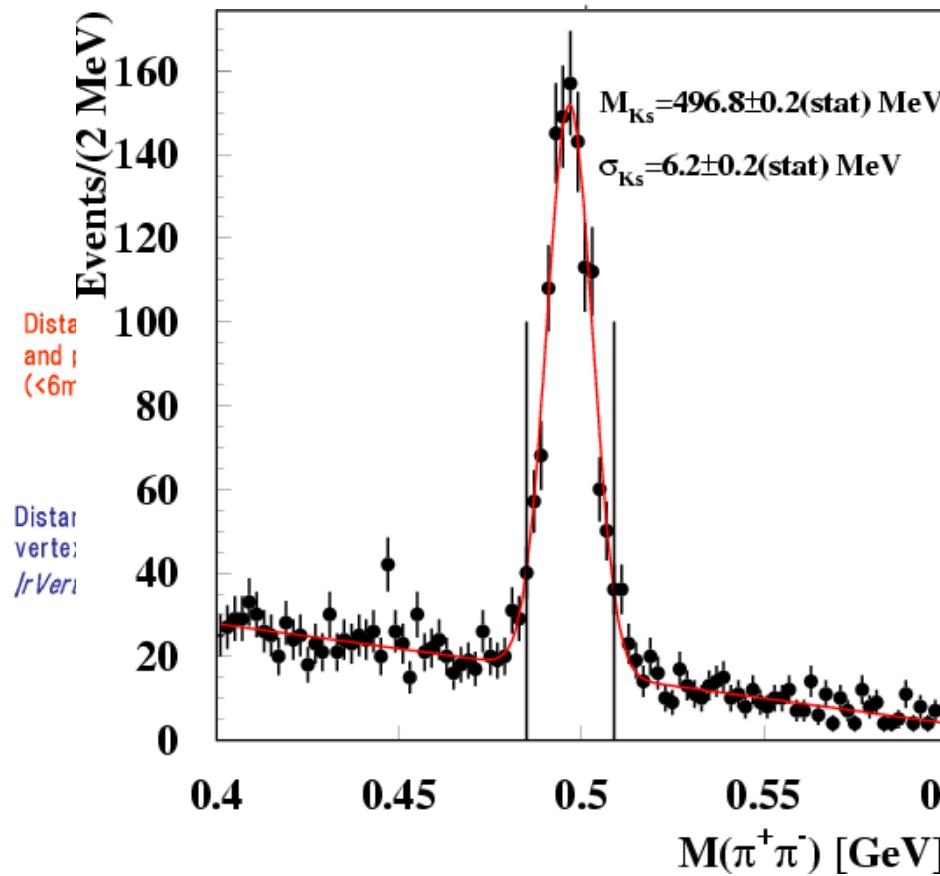

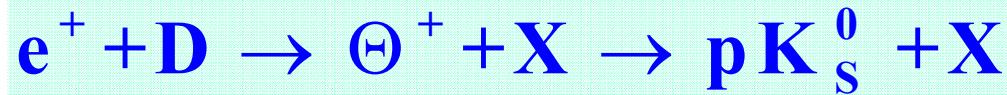

Dual radiator RICH

- aerogel:  $n=1.03$
- $\text{C}_4\text{F}_{10}$  gas:  $n=1.0014$

Pentaquark05 – Oct 2005

# Event Reconstruction

$\tau: 1\text{--}15 \text{ GeV} \quad p: 4\text{--}9 \text{ GeV}$

on of each decay particle,

$$M(\pi^+\pi^-) [\text{GeV}]^{-1}$$

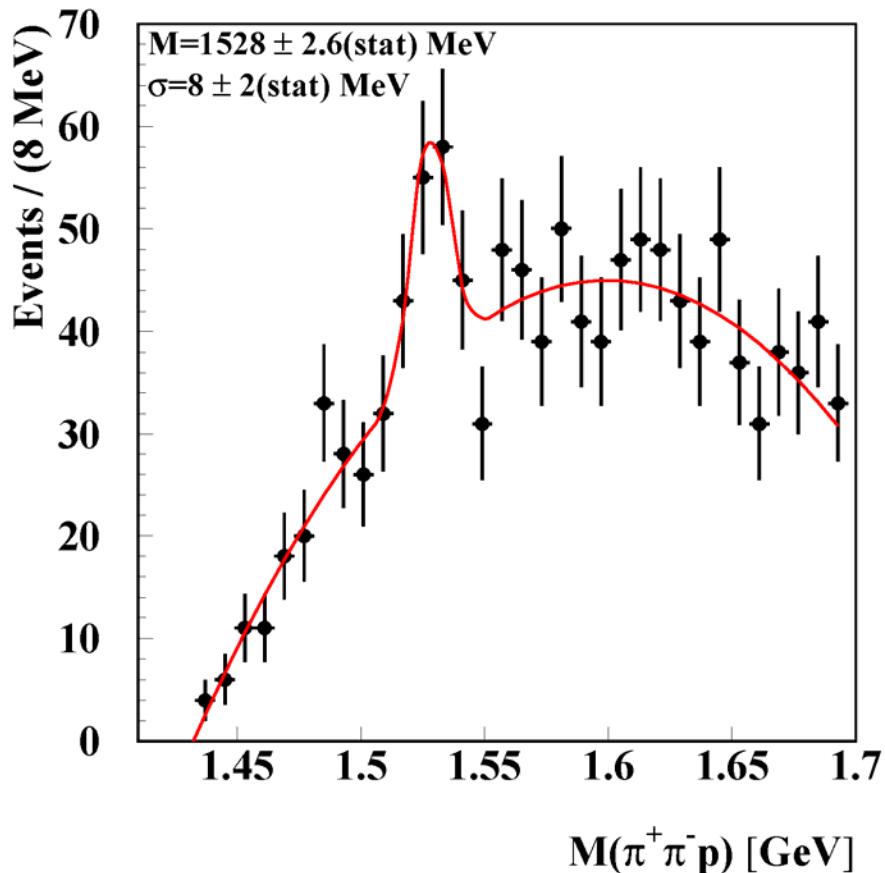

- Suppress contamination from  $\Lambda(1116) \rightarrow p\pi^-$

W. Lorenzon

Pentaquark05 – Oct 2005

# Invariant Mass Distribution of $p\pi^+\pi^-$

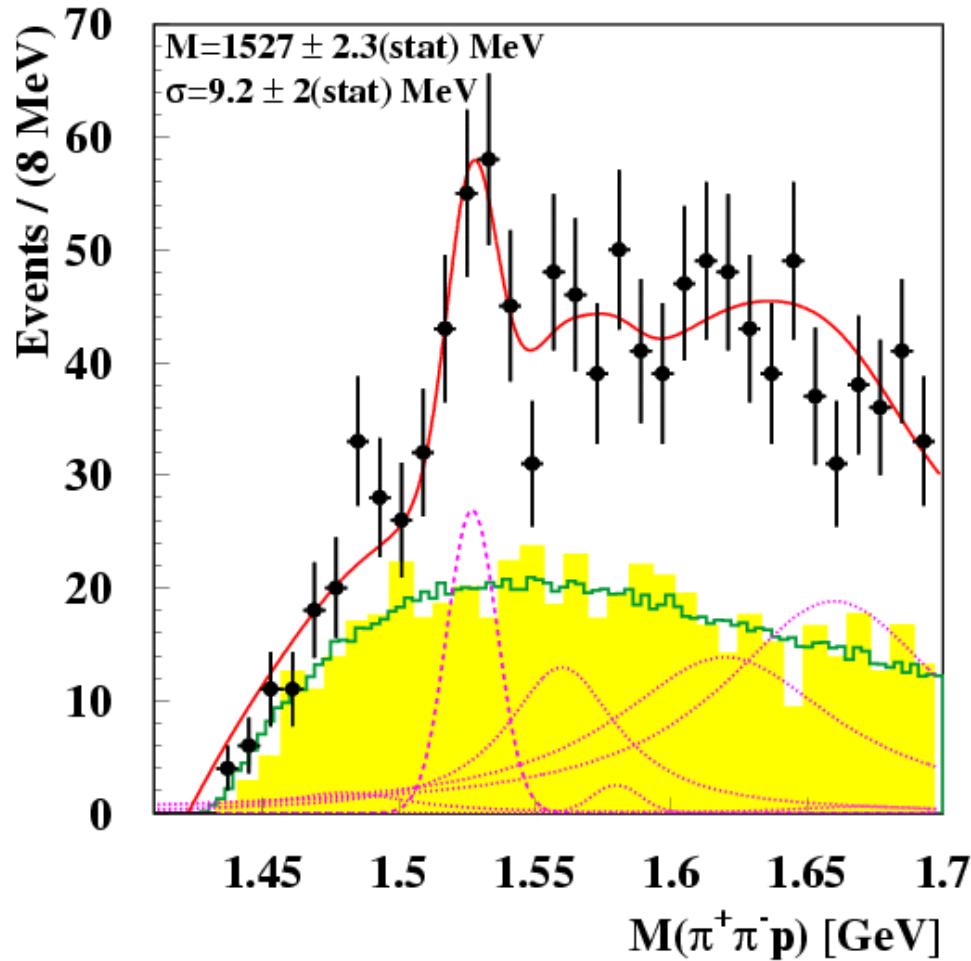

- events selected in a  $\pm 2\sigma$  window about  $K_S$  peak
- Peak is observed at  $1528 \pm 2.6(\text{stat}) \pm 2.1(\text{syst})$  MeV in  $pK_S$  invariant mass distribution
- Width,  $\sigma = 8$  MeV, is observably larger than experimental resolution
- No known positively charged strange baryon in this mass region
- Statistical significance is 3–5  $\sigma$
- Three models of background were studied

W. Lorenzon

Pentaquark05 – Oct 2005

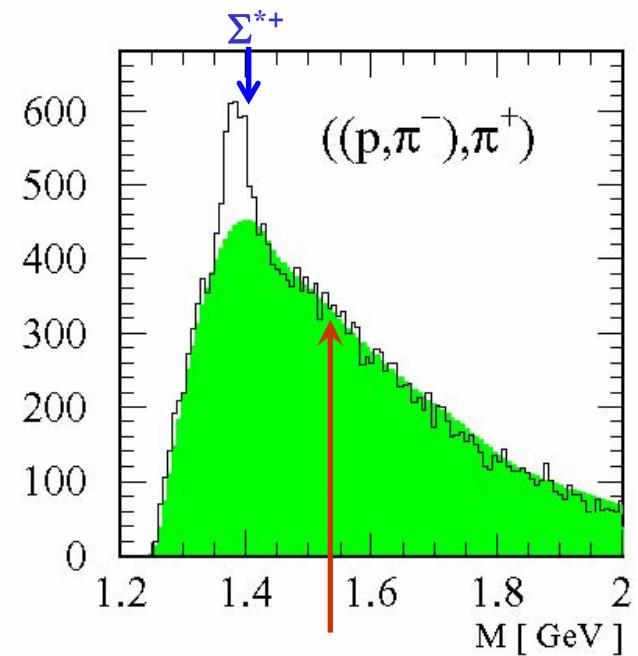

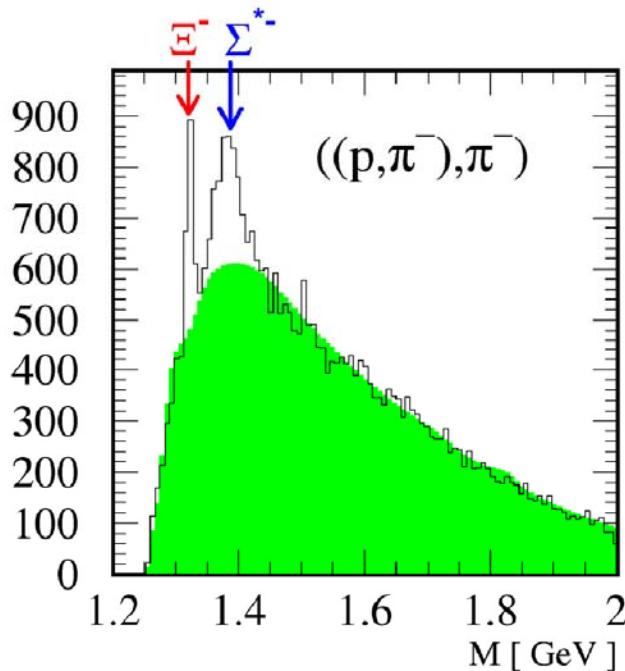

# PYTHIA6 and mixed-event backgrounds

- Filled histogram: PYTHIA6 MC (lumi normalized): No resonance structure from reflections of known mesonic or baryonic resonances
- Green histogram: mixed event background normalized to PYTHIA6: reproduces the shape of PYTHIA6 simulation
- Excited  $\Sigma^*$  hyperons not included in PYTHIA6 lie below 1500 MeV and above 1550 MeV
- Mass =  $1527 \pm 2.3 \text{ MeV}$
- $\sigma = 9.2 \pm 2 \text{ MeV}$
- Significance  $4.3\sigma$

# $\Theta^+$ or $\Sigma^{*+}$ ?

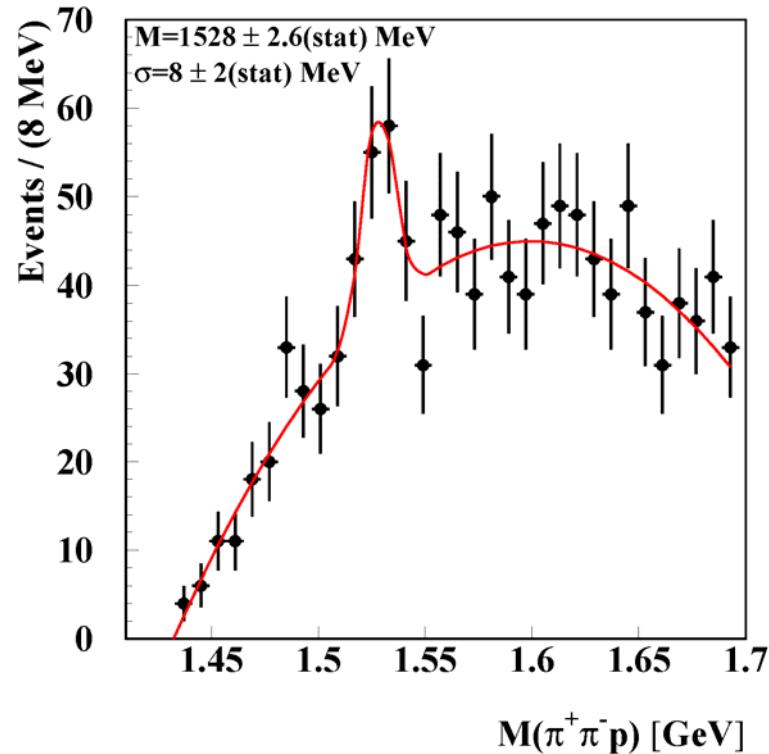

- Is our peak a previously missing  $\Sigma^*$  or a pentaquark state?
- If peak is  $\Sigma^{*+} \Rightarrow$  also see a peak in  $M(\Lambda\pi^+)$

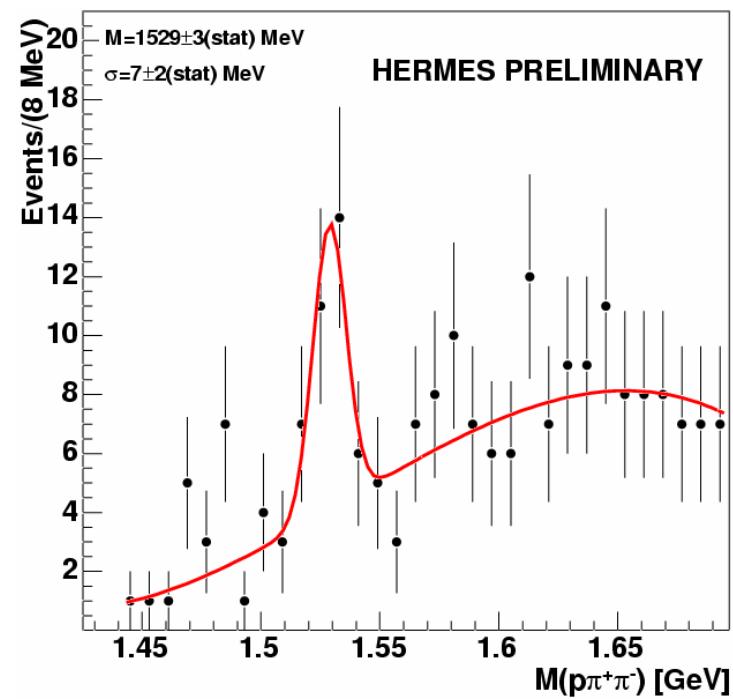

No peak in  $\Lambda\pi^+$  spectrum near 1530 MeV

→ but no  $\Sigma^*$ s (1480, 1560, 1580, 1620) too!!!!  
should we say all bumps in  $pK_s$  spectrum are pentaquarks?

# Further background suppression - additional $\pi$

➤ signal/background: 1:3

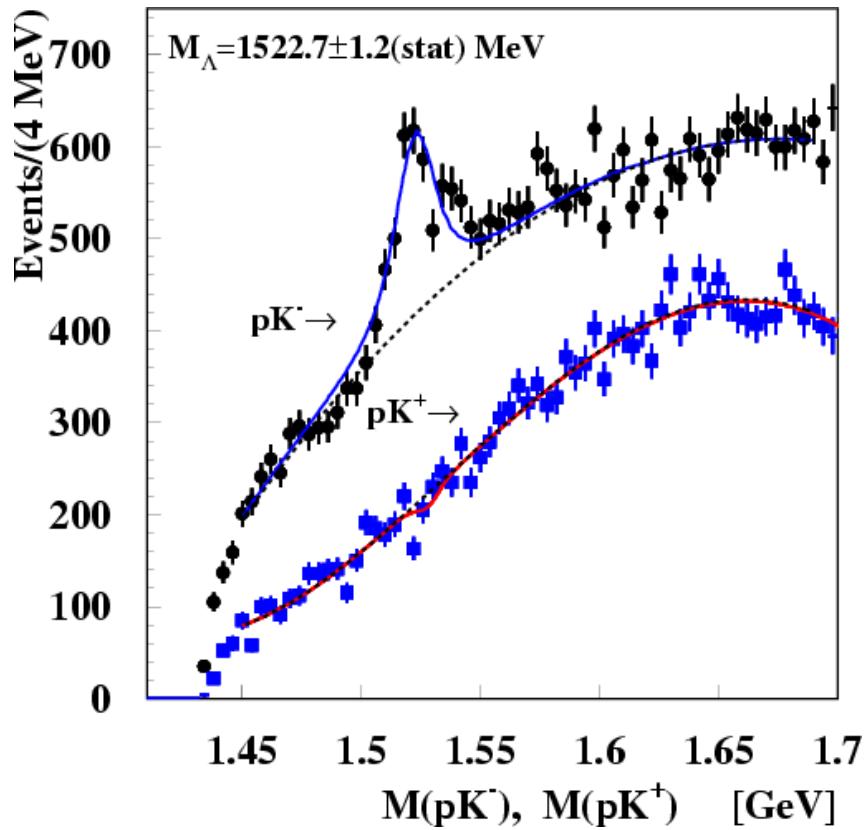

➤ signal/background: 2:1  
same kinematic cuts

W. Lorenzon

Pentaquark05 – Oct 2005

# What is the Isospin of the $\Theta^+$ ?

In the decay channels:

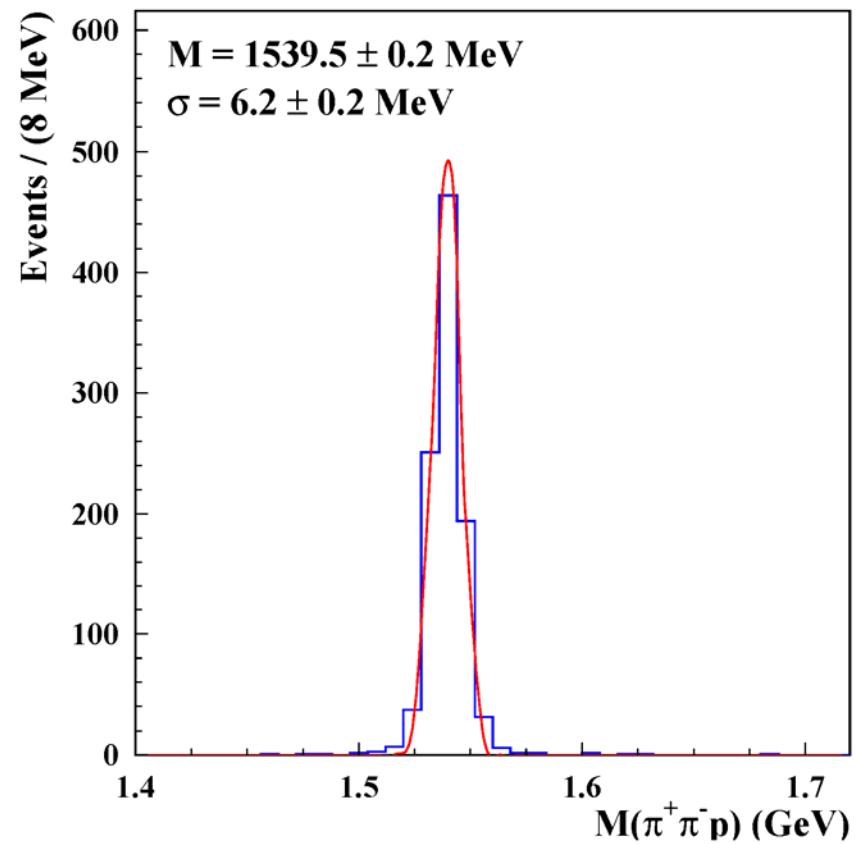

- pK<sup>-</sup>: clear  $\Lambda(1520)$  peak at 1522.7 MeV
- pK<sup>+</sup>: no peak, zero counts at 91% C.L.

Not isotensor

→ probably **isosinglet**

# Width of Peak

- $\Theta^+$  Monte Carlo with complete detector simulation
- generated peak:  
 $M=1540 \text{ MeV}$ ,  $\sigma=2 \text{ MeV}$
- reconstructed peak:  
 $M=1539.5 \text{ MeV}$ ,  $\sigma=6.2 \text{ MeV}$   
 $\Delta_{\text{detect.}}(\text{FWHM}) = 10\text{--}14.6 \text{ MeV}$
- $\text{FWHM}_{\text{meas.}} = 19\text{--}24 \text{ MeV}$

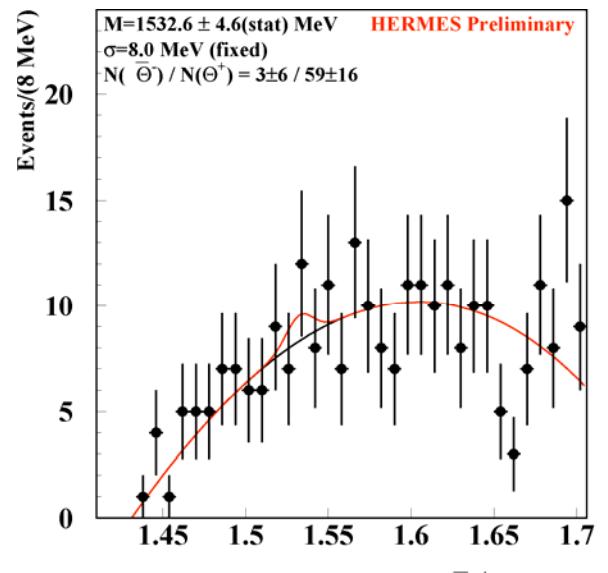

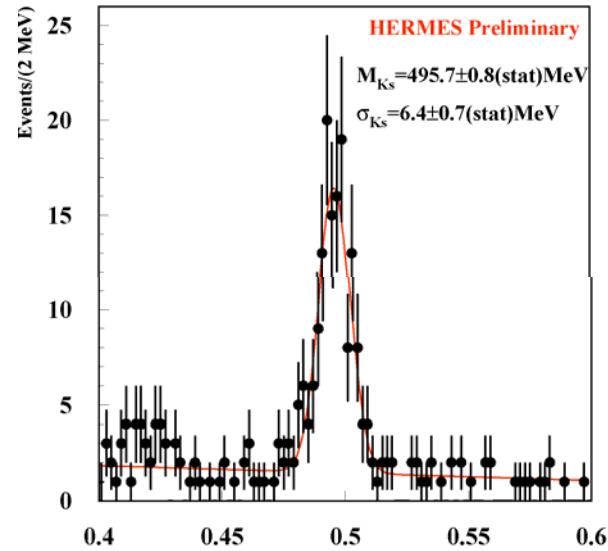

*Intrinsic width:  $\Gamma = 17 \pm 9 \pm 3 \text{ MeV}$*

# Invariant Mass Distribution of $\bar{p}\pi^+\pi^-$

- Goal: compare cross section ratio of  $\Theta^-$  to  $\Theta^+$  production with ratio of  $\bar{\Lambda}(1520)$  to  $\Lambda(1520)$  production ( $\sim 1:5$ ) or  $\bar{\Xi}^0(1530)$  to  $\Xi^0(1530)$  production ( $1:4$ )  
→ shed light on production mechanism
- same event selection and kinematic constraints as for  $p\pi^+\pi^-$
- Gaussian plus 3<sup>rd</sup> order polynomial, width of Gaussian fixed
- no peak is observed
  - hint that in HERMES kinematics target-remnant plays an important role different to ZEUS, which has basically the same number of  $\Theta^+$  and  $\Theta^-$ .

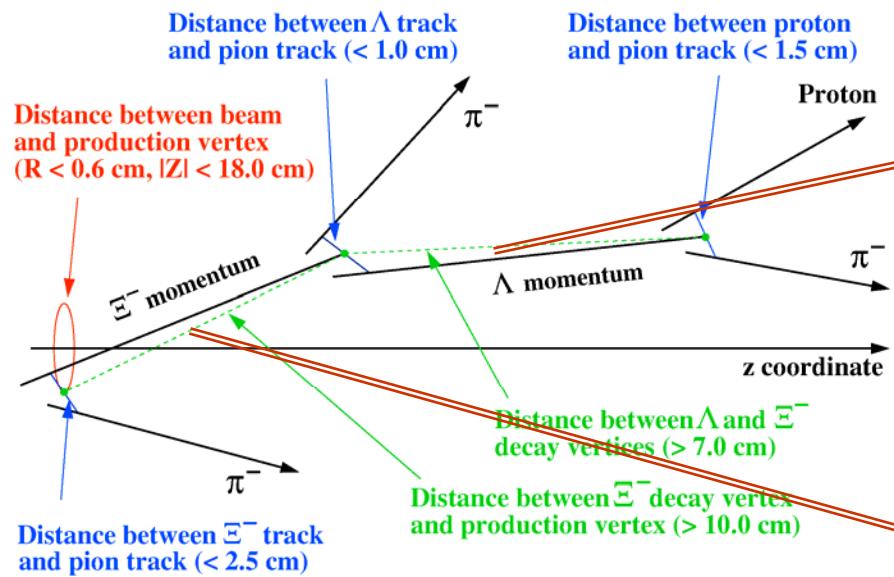

W. Lorenzon

Pentaquark05 – Oct 2005

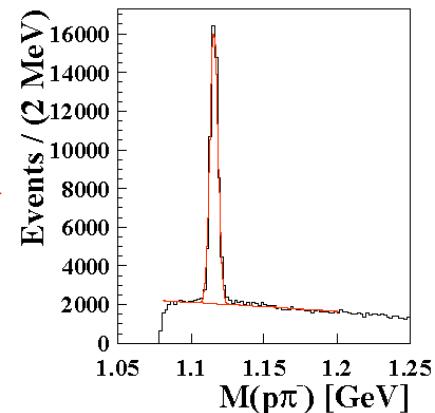

# Search for reported $\Xi^-(1862)$ Exotic

➤ Channel:  $\Xi^{--} \rightarrow \Xi^- \pi^- \rightarrow \Lambda \pi^- \pi^-$

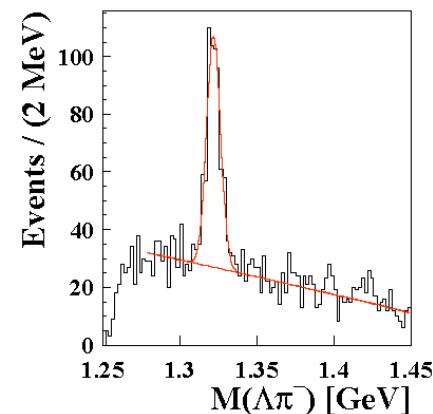

➤ Topology:

➤  $M(p\pi^-)$  with  $\Lambda$

➤  $M(p\pi^-\pi^-)$  with  $\Xi^-$

- Selected  $\Lambda$  events ( $2\sigma$  window)
- Selected  $\Xi^-$  events ( $2\sigma$  window)

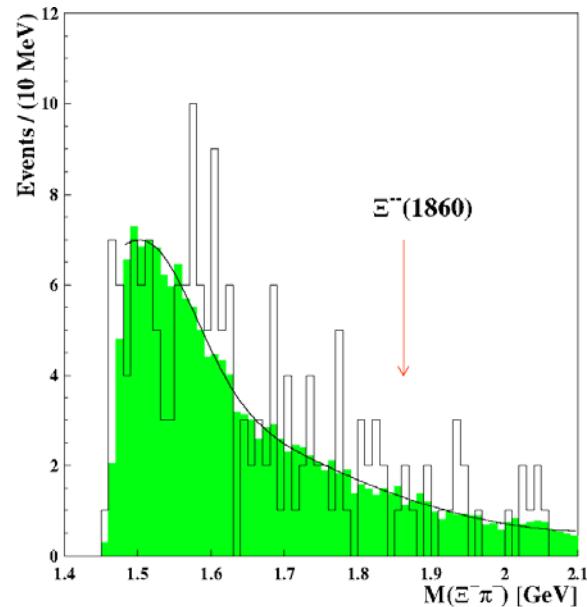

W. Lorenzon

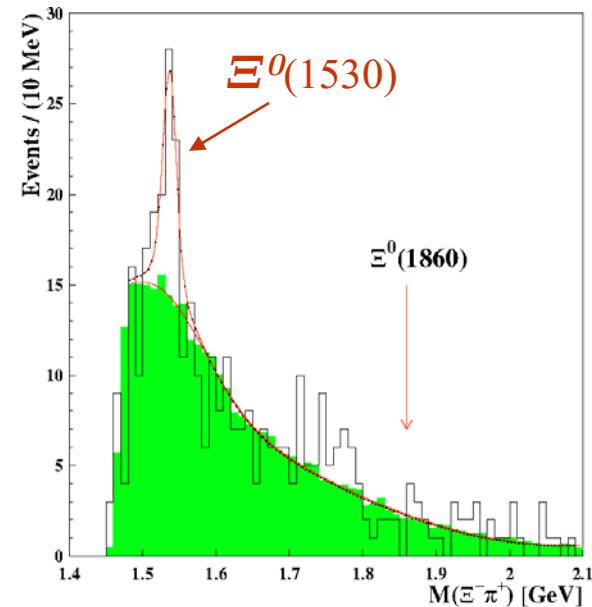

Pentaquark05 – Oct 2005

# $\Xi^{--}(1862)$ search (II)

- $M(p\pi^-\pi^-\pi^-)$  spectrum

- $M(p\pi^+\pi^-\pi^-)$  spectrum

- mixed-event background
- No  $\Xi$  peaks around 1860 MeV
- $\Xi^0(1530)$  seen, as expected

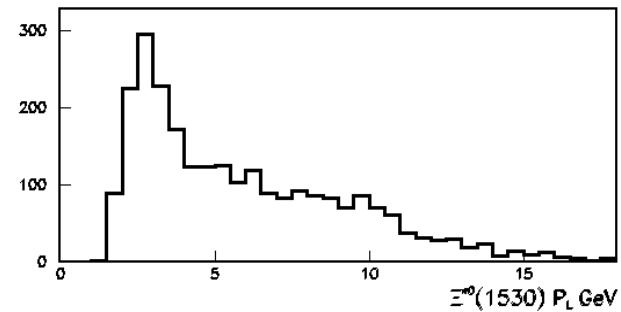

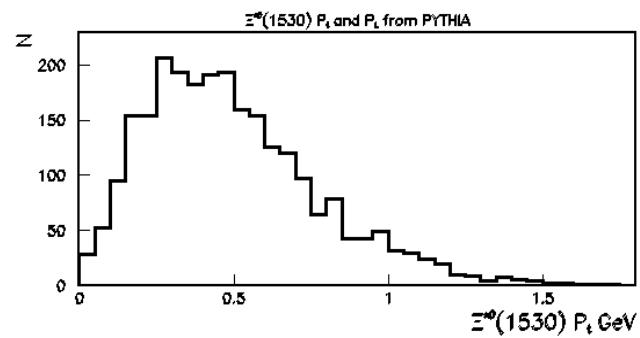

- upper limit  $\sigma(\Xi^{--})$ : 1.0–2.1 nb
- upper limit  $\sigma(\Xi^0)$ : 1.2–2.5 nb
- $\sigma(\Xi^0(1530)) = 8.8\text{--}24 \text{ nb}$

# Production Cross Sections

- Integrated luminosity:  $290 \text{ pb}^{-1}$
- all measurements done in quasi-real photoproduction ( $Q^2 << 1 \text{ GeV}^2$ )
- Acceptances from Monte Carlo:
  - $\Lambda(1520)$ : 1.5%
  - $\Theta^+$ : 0.05%
  - $\Xi^0(1530)$ : 0.036-0.1%
  - $\Xi^0(1860)$ : 0.065%
  - $\Xi^{--}(1860)$ : 0.031%

$\sigma(\Theta^+) = 100-220 \text{ nb} \pm 25\%(\text{stat})$   
(add.  $\times 2$  from prod. kinematics)

PYTHIA6  $p_t$  and  $p_z$  spectra

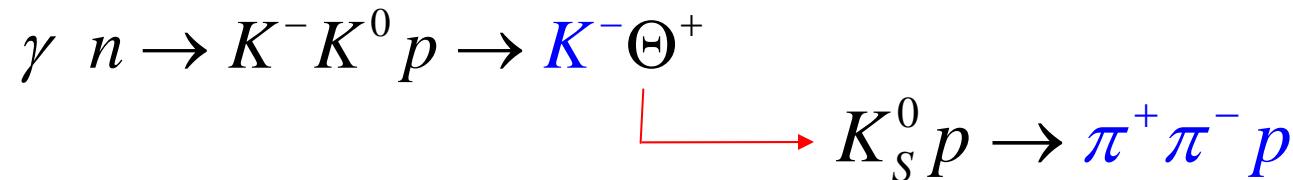

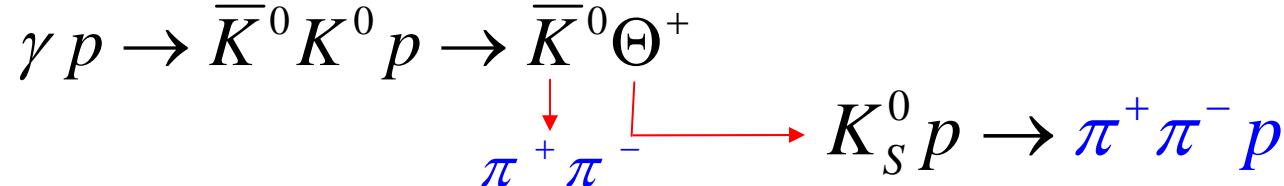

OR:  $p_t$  and  $p_z$  spectra from  $\Lambda_{\text{exp}}$

$$\sigma(\Lambda(1520)) = 62 \pm 11 \text{ nb}$$
$$\sigma(\Xi^0(1530)) = 8.8-24 \text{ nb}$$

# Production process at HERMES ?

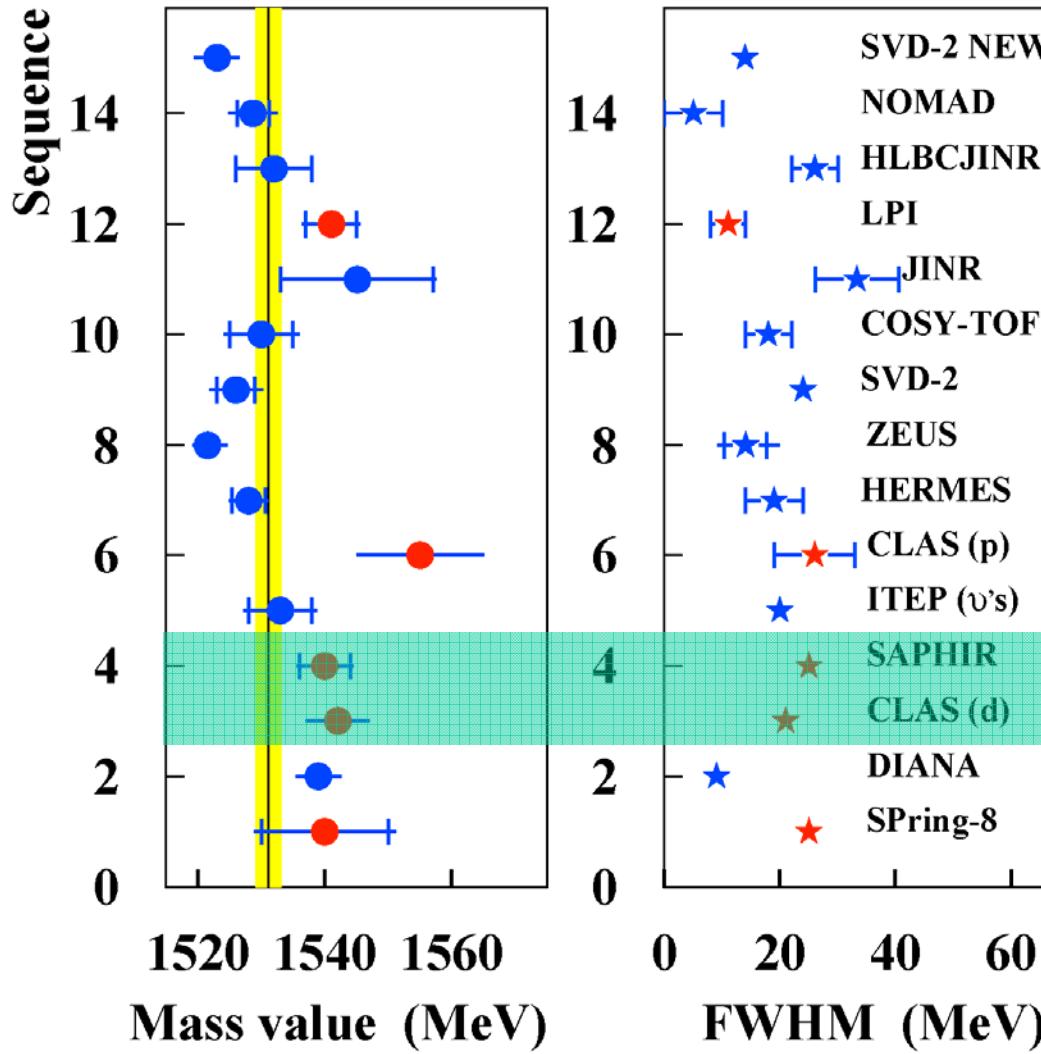

- can additional pion come from exclusive processes?

- associated  $K^-$  or  $K_s$  from exclusive processes goes backward
  - even decay pions from  $K_s$  are inaccessible
  - PID threshold requires  $p(\Theta^+) > 7 \text{ GeV}/c$
- tagged pions events cannot come from these exclusive processes
  - ⇒ production process has to be at least partially inclusive
    - inclusive processes increase with higher energy
    - exclusive processes decrease with higher energy

# Comparison with World Data

Decay channel:

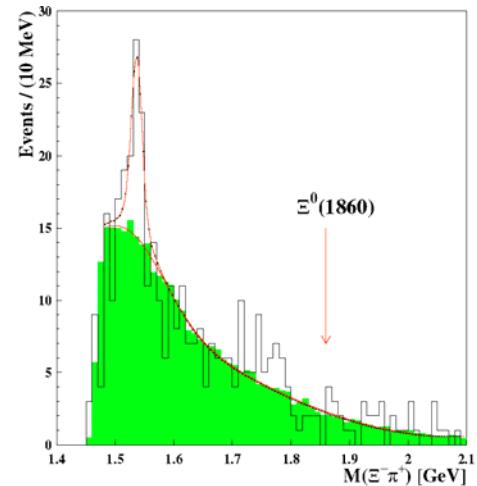

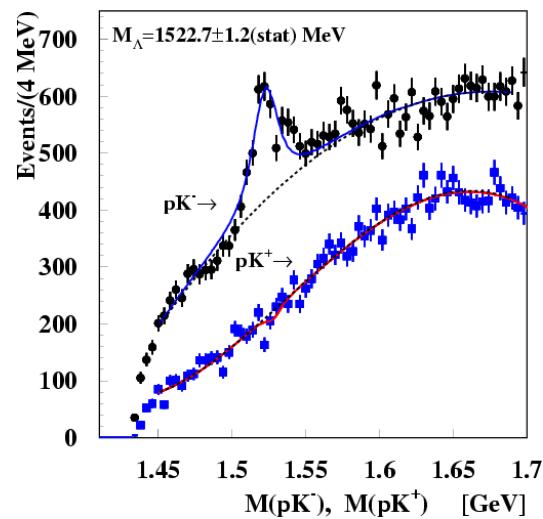

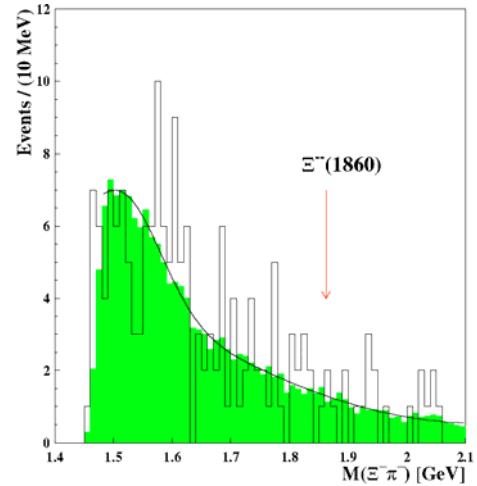

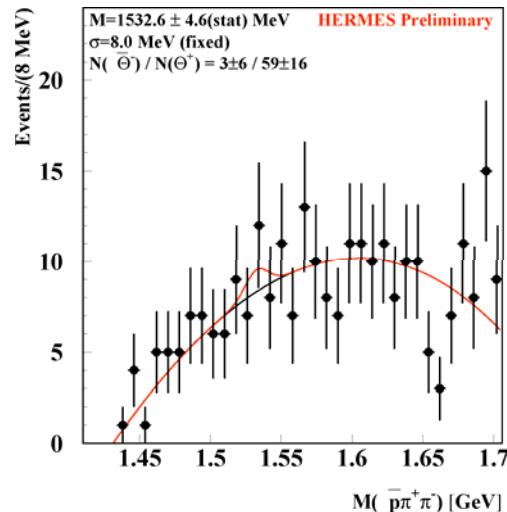

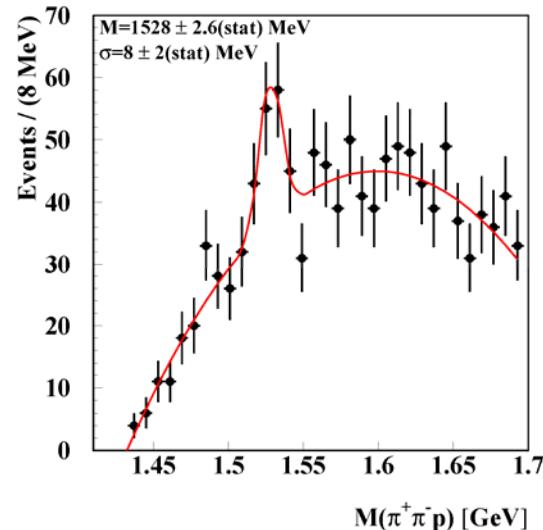

$nK^+$   $pK_s^0$

World Average:  
 **$1531.1 \pm 2.1$  MeV**

Observation of peak in two decay channels in same experiment

→ would be convincing!

# Summary – HERMES results on 5q exotics

PLB 585 (2004) 213

W. Lorenzon

PRD 71 (2005) 032004

Pentaquark05 – Oct 2005

# Conclusions and Outlook

- Direct reconstruction of  $pK_s$  invariant mass

$$eD \rightarrow \Theta^+ + X \rightarrow pK_s^0 + X$$

- Mass:  $M = 1528.2 \pm 2.6(stat) \pm 2.1(syst)$  MeV

Intrinsic Width:  $\Gamma_{\Theta^+} = 17 \pm 9 \pm 3$  MeV

Significance:  $\sim 4 \sigma$

- $\Theta^+$  is probably an isosinglet
- additional  $\pi$  improves signal/background,  
→ eliminates  $K_S$  contamination from various processes
- Production process is at least partially inclusive
- No evidence observed for  $\Xi^-$  or  $\Xi^0$  near 1860 MeV
- Anticipate x5 higher statistics by summer 2007
