LOCUS DESCRIPTION:
Uppermost locus of the trench covering the entirety of the trench. Characterized by a brownish/gray soil and pottery of the modern era. Seems to lie directly over a layer of antique soil rather than subsoil. Large inclusions, scrub, roots, loose soil, some mudbrick, and painted plaster (which would continue to a much deeper level) were all a part of this locus. The rubble patches discovered in this locus were all disassociated and floating on soil.

7. SEDIMENT ANALYSIS/FLOAT

LOCUS DESCRIPTION:

After the removal of the topsoil and some of the rubble piles from the previous locus, further rubble piles began to appear in the Western and Southern portions of trench. It became apparent that two large ashlar blocks in the NW corner of the trench might have been a very late feature which at first glance appeared to line up with some larger rubble blocks in the Southern balk of CB 4.7 which also runs from the NW-SE. Another possibility was that the ashlar blocks may have been in line with a single course of 3-4 large stones that extended out of the Eastern balk. It is possible that these stones may also lie in conjunction with some with some stones in CB 2.4 in the NW/SW quadrant where a course of stones comes out of the W balk and then immediately terminates. A semicircular layer of stones/rubble was also noted in the SE corner of the trench, although upon further excavation these stones formed no discernable feature.

An abundance of plaster was again noted in this locus, and some mudbrick from the center of the locus was also noted. The soil itself was very dark gray in color and loose with limestone throughout the entirety of the trench. The soil was not unlike that from the previous locus (CB 36060), and therefore probably should not be assigned to a subsoil layer. The pottery evidence, all from the late 1st c. BC-early 1st c. AD, provides further evidence that we are now below modern layers even if the soil seems not to have changed.

7. SEDIMENT ANALYSIS/FLOAT

LOCUS DESCRIPTION:

Located in the majority of the trench, in all but the NW corner, and again characterized by several rubble piles that were to be removed as quickly as possible, this locus provided the trench with its first two several features. The patch of semi-circular stones located in the SE from the previous locus was found to be floating, and was therefore removed. The same can be said for the larger stones in the Eastern portion of the trench which seem not to have been associated with any part of CB 3.6. Both of these rubble piles did not form any significant features, but appear to have fallen or collapsed in this manner. The two major features which dominated the locus are the western wall (which made its first appearance in CB 3.6.009 but extends down to CB 3.6.008 in the SW portion of the unit) and what would later be evident as two column drums (of a late wall), but were upon first impression thought to be column bases. The diameters of the two column bases/drums are very similar to those in the CB 24010, the East/West wall which dominates almost the entirety of the trench. Due to the distance between the column bases/drums it was at first postulated that perhaps a colonnade existed here-although this would be disproved at a later date.

In the Eastern portion of the trench the first soil change became very evident as the topsoil layer, grayish/brown, descended upon a darker brown soil. The soil was loose and fine for the most part with many inclusions of plaster and rubble. Due to the proximity to the topsoil, roots were still evident. This locus touches CB 36003 in the NW corner of the trench.

LOCUS DESCRIPTION:
The beginning portion of the locus was based on units 007 and 009- isolated in the NW corner of the trench and divided in this manner due to a significant amount of mudbrick and plaster that was nowhere else evident in the trench. Indeed, the amount of plaster in these units almost outweighed the amount of pottery. The amount of plaster in these units seemed to indicate that some sort of plaster feature was located in this area of the trench, and sure enough the large N-S running plaster wall appeared in 009. Unit 010 was an entire trench pass with a lack of mudbrick except for in the Central portion of the trench in which a semi-circular structure became evident. One of the volunteers immediately recognized this feature as a potential tabun/tanur. Between the column bases some further large stones were discovered which seemed to be in association with one another. It was in unit 011 that it became evident that the column drums were not a colonnade but rather some late wall. A third column was discovered between the two previous ones, therefore being much too close to one another.

The tabun/tanur units, 012 and 016, were a cleaning unit that extended all the way to the Western wall and was obvious later deposition of soil. Some bone and a thin gray layer of soil was discovered within the tabun, but not in the abundances that one might expect from an oven. In unit 013 another portion of the column wall was discovered in the form of large ashlar blocks running right to the west of the columns. These large ashlar blocks seem to lie in conjunction with the columns and form one wall.

The soil was fairly similar in all cases, characterized by brown, loose, fine soil with plaster and medium-sized rubble inclusions.

LOCUS DESCRIPTION:

The basin/bench first really discovered in unit 010 became very apparent in unit 015, that was the first real excavation of the center of this feature. The four units that comprised this locus were all robber fill or later fill, and it was obvious that it was necessary to excavate to a deep layer in order to reach the original fill. Throughout the excavation of these four units much plaster, which probably belonged to the original facing of this wall, was discovered within the basin, as well as much rubble and some mudbrick. A small patch of the collapsed plaster was pedestalized in the eastern portion of the basin that seems to provide evidence of the fact that some plaster collapsed inwards from the trough. In unit 032, the final pass of this locus, the original stone cobbles that filled the basin were discovered and articulated. Just to the south of this feature, adjacent to the southern wall, a floor of some sort extended into the southern balk, but did not allow for a very good look.

The soil within this locus was very similar throughout the entire basin until the final unit-brown, loose, with many small rubble inclusions. Finally, in unit 032, the soil changed to a much clayier, denser soil where pottery was less abundant and the rubble was fixed to the soil.

LOCUS DESCRIPTION:

Covering the majority of the western portion of the trench this locus produced another one of the features within the trench, specifically the plaster floor which ran up against the Western wall and basin in the SW section of the trench. This plaster floor seems to run up to the same level as both walls, and thus these contemporaneous features seem to make up the earliest features in the trench as well. A single line of stones about two courses thick ran East to West from the column/ashlar wall to the Western wall. This course may have been an addition to the column wall and would therefore be assigned to a later date, but it appears to have no solid connection to the plaster wall itself. It did however, divide portions of the trench into an interior section in the NW and an exterior section in the remainder of the trench. The course was soon found to be floating on a layer of soil with no foundation features in association. The real ambiguity of this locus comes from the pottery that was discovered in unit 014. The discovery of Ras-al-Fukhra and Byzantine pottery in 014 could be attributed to possible contamination from layers above, but some other sources of explanation are also probable.

The soil was the same in both units, brown and fairly loose and fine. Fewer inclusions were noted, although plaster and some mudbrick were prevalent.

LOCUS DESCRIPTION:
Removal of large amount of large stones from Eastern balk which shall help to define further the colonnade and ashlar block wall. Removal of this locus was done after much of the trench had been taken down to a significantly deeper level.

Very little soil was associated with this locus, and the amount of pottery from this single unit locus was very insignificant. The inclusions were very large and extended partly into the Eastern balk.

LOCUS DESCRIPTION:

Locus 007 was predominantly situated in the SE portion of the trench, and showed up quite nicely in the Eastern balk. A dark gray layer of loose soil at this depth could also be seen at the top of the remaining plaster fragments of the basin in the Southern portion of the trench. Much of the purpose of this locus was to attempt to pedestal the Eastern portion of the column wall in order to uncover exactly upon what the drums were resting. In the same vein soil was removed from between the drums and the large ashlar blocks that lay beside them, and it was obvious that both were a part of the same episode. It was also in this locus that it became evident that the East-West running line of rubble associated with the column drum wall was floating on nothing but a layer of soil. The gray layer of soil was unique enough to warrant a soil sample, from which no result has yet been obtained.

The pottery of this locus was extremely similar in almost all regards. 1st c. BC cookware or Gamla jar was present in almost all of the units associated with this locus.

LOCUS DESCRIPTION:

This single unit locus was confined to the NE corner of the trench and was typified by a curious layer of rubble that did not extend into either the Northern or Eastern balk. The cobbles appear to have been placed in this position at a later date due to the fact that some of them ran directly under the wall. The removal of these cobbles was done in order to pedestal further the column drum wall just west of the locus. The soil in this locus was the dark gray soil that could be seen in the Eastern balk at this level, although in this Northern section of the trench the soil in the balk had thinned out to an almost unnoticeable degree. The LDM was conveniently located directly under the cobbles up against northernmost column drum (Baggy Jar).

7. SEDIMENT ANALYSIS/FLOAT

LOCUS DESCRIPTION:

010 was the removal of the column drum/ashlar block wall in different episodes. The ashlar blocks were the first portion of the wall to be removed, and after having been inspected for any sort of inscription or significant markings, the sealed unit underneath was excavated. This unit (CB 3.6.039) yielded very little pottery, and was taken down to a layer of limestone rubble that seems to have provided the foundation for these blocks. Directly thereafter, the soil underneath the limestone was brought down to the level of the rest of the trench. Once the ashlar blocks were removed the column drums were the next order of business. The sealed unit underneath the columns in the NE portions also yielded very little pottery, but secure dates were established even though this area of the trench was improperly excavated (units were not assigned to the columns or ashlar blocks before they were removed).

LOCUS DESCRIPTION:

Limited to the NW corner of the trench, locus 011 comprised two passes within the interior of the late column wall and the late rubble course to the south. Some rubble and some ashy soil were discovered herein. Although this locus has correctly been designated as the interior of the late wall feature (the tabun lies to the South on the outside of this feature), its soil was not inconsistent with the soil outside of the interior. The soil was brown, soft and fine with a few small inclusions, but plaster and pottery were quite prevalent. It is in this locus that the East to West running wall associated with the column drum was incorrectly removed (not given it's own unit). This mistake seems not to have affected any evidence in a negative fashion.

LOCUS DESCRIPTION:

It was within this L-shaped locus that was contained within the Western and SE sections of the trench. An abundance of pottery characterized unit 036, and it was within this unit that the ashlar blocks in the Eastern wall were discovered to be floating on soil and limestone rubble. Unit 037 was very much approached along the same lines as an opportunity to examine what lay underneath the column drums that were floating on soil. Some mudbrick characterized this unit which ran up to the Eastern balk, and now became part of a new soil layer in this section of the trench (visible in the balk). This new soil, light brown and packed very tightly, perhaps could have been some type of floor or foundation for the floor, but sadly, no real evidence for this assumptions remains in this portion of the trench.

LOCUS DESCRIPTION:

This large locus was responsible for an enormous amount of pottery that had heretofore gone unmatched in the trench. The units excavated early in this locus were for the most part located in the Western portion of the trench, and were the final passes taken in order to pedestal the columns prior to removal. Once the column drums were removed from their position in the trench (CB 36010) an entire trench pass was taken and some rubble was discovered in the SE portion of the trench. The last two units in this trench were deep passes full of pottery and small inclusions that were designed to locate some type of floor level- unfortunately, this never materialized. It was at this point too that a very large amount of bone-more than at any previous point- was discovered. The same phenomenon occurred in Bjorn's trench but a higher level. In the NW corner of the trench, a layer of cobbles, perhaps not unlike the ones seen previously in the NE corner up against the column drums, appeared out of nowhere. Again, the cobbles did not appear to continue into the balk, and they abutted the foundations(?) of the plaster wall to the west.

The soil in this locus was the final type of soil that was encountered in CB 3 6, and was very dark brown in color, partly packed/partly sandy and fine, and full of pottery.

LOCUS DESCRIPTION:
One of the two end loci as far as passes in the trench were concerned, this locus was
situated in the majority of the trench, minus the Southern rubble units directly North of the basin.
The goal here was to take as many major final passes in hopes of being rewarded with a floor,
which was once again not the case. The amount of pottery and bone remained fairly consistent
with the overlying locus however, and therefore an abundance of both was pulled out of the
trench. The soil itself varied from a light to dark brown depending on whether or not one was
working in the West or the East respectively. There were significantly fewer inclusions within
this Northern portion of the trench than in the South, and those stone inclusions that did occur
were for the most part significantly smaller.

LOCUS DESCRIPTION:

Confined to the Southern portion of the trench, just North of the basin, this locus has shown evidence of some sort of rubble collapse or robbing. The large inclusions that either abut or run under the basin (this is unclear due to the layer of soil left on the basin to protect the plaster) seem not to have been a part of the interior of the basin—the rubble stones are much too large to have ever been a part of the interior. The rubble extends throughout the entire southern portion, and is visible underneath the plaster floor to some extent as well. It is unclear as to what this rubble might have been, but it does seem to belong to some early episode within the trench. The soil itself is very similar to the remainder of the trench with the inclusions being the only significant difference between this locus and locus 014.

7. SEDIMENT ANALYSIS/FLOAT

LOCUS DESCRIPTION:

The largest feature within the trench, and also one of the earliest features in the trench, the wall dominated the entire Western half of the trench. The wall itself was lined with plaster to the level of the plaster floor in the SW portion of the trench (CB36019), but this was not known until the final day of excavation. Up to this point, a layer of soil was kept over the plaster in order to preserve it more fully, but once the layer was removed it was obvious that the wall ran upon the wall. It is fairly evident as well that the basin in the Southern portion of the trench (CB36020) is contemporaneous with Western wall.

The wall itself is composed of many medium-sized inclusions packed tightly together several courses thick (unsure as to how many since the wall runs into the balk). The plaster itself is in a poor state of preservation and required immediate conservation once exposed to the elements.

LOCUS DESCRIPTION:

Plaster floor in the SW corner of the trench that ran into the Southern balk and was contemporaneous with the plaster wall to the West (CB36018) and the basin in the South (CB36020). Only a small fragment of the floor remained, but both the basin and the plaster wall ran up to it and are associated with the floor. It is unclear as to what happened to the remainder of the floor, but there appears to be no evidence of any other portion of the floor. It has been assumed that these features were all similar to a structure at Tel Anafa, a bathhouse structure which appears extremely similar to that at Anafa.

LOCUS DESCRIPTION:
Basin in the Southern portion of the trench that appears to have been robbed of the majority of its fill. Plaster lined both the Northern and Southern walls of the basin, and an abundance of plaster was discovered within the basin itself. A wall of plaster in the Western portion of the basin abutted the plaster floor (CB36019) and was a part of an entire structure that included the Western wall (CB36018). Much soil and large rubble filled the inside of the basin, but it became apparent that by unit 032 the original cobble fill of the basin had been reached. The basin also seems to have been a part of locus 021, a floor (?) which runs into the Southern balk.

LOCUS DESCRIPTION:

The locus appeared in the final cleaning unit of the trench before final photos just South of the basin. It extends into the Southern balk, but is difficult to judge as far as thickness and extent is concerned. This feature is a part of the entire basin, floor, and plaster wall structure that was most likely a part of a bath structure. Further excavation to the South of the trench is necessary in order to determine exactly what role this floor played in relation to the rest of these features. Again, it appears as if this feature is very similar to that at Tel Anafa.

LOCUS DESCRIPTION:

Small course of stones that ran East to West and appeared to form a portion of a later wall 
in the Northwestern portion of the trench. This wall ran from locus 022 to the plaster wall in the 
West, but was found to be floating on soil once the stones were articulated and pedestaled. This 
course of stones and the related wall to the East seem to have constituted a division between an 
interior portion and an exterior portion of a later structure. This is further evidenced by the 
location of a late period tabun in the exterior of this structure. Exactly what sort of 
interior/exterior these features would have comprised is not clear, although re-use was obvious.

LOCUS DESCRIPTION:

This locus was a mudbrick tabun in the South Central portion of the trench that was formed in a semi-circular pattern. The tabun seems to have been the only feature of its kind thus far discovered at Tel Kedesh, although it did not yield very much information (perhaps due to its poor state of preservation). Most likely the one of the latest features within the entire trench, very little evidence of burning/cooking was discovered in the removal unit or passes taken nearby. The tabun was located in the exterior of the locus 023 which seems to fit with the phasing of this structure within the context of the trench.

LOCUS DESCRIPTION: INCLUDE 1. PHYSICAL DESCRIPTION, PRESERVATION, EXTENT 2. RELATION TO OTHER LOCI IE OVER/UNDER/TOUCHING/BONDDING WITH OTHER FLOORS/FILLS/WALLS ETC. USE OTHER SIDE OF SHEET IF NECESSARY.

Paving stones running up against (but higher than the founding level of) wall CB36037.

Fairly large stones - a heavy-duty surface.

Only 9 stones extant - no indication if there were once more. Unit 086 is soil from between the stones.

Med bin, med concretion soil with some rocks. (Though not as many as CB36027)
Entirely on @ side of crappy N/S wall (CB36086)
Fill
Touches fill CB36027 it is underneath CB36025
A good amount of metal found here, not as much as CB36027, but perhaps close to or the same density of metal to buckets of earth dug as that from CB36027.
