Locum 028 includes the compromised floor under the renamed jar layer in the western portion of the trench and in the potential of the southern edge of the trench. The soil was yellowish gray, tenacious, crumbly, fine, with small chips of plaster, floating. To the east of this locum is CB18010.1, the fill that was in a secure layer under a plaster floor, which was much better preserved. To the west of this locus was the N/S wall (CB18007) and to the south was the E/W wall (CB18008) as well as the robbed-out continuation of that wall.
