Topsoil. Varying thickness across the entire 2 x 2m trench,
covering the thick rubble/collapse loci [82001].

Relatively thick layer of architectural collapse. Very little soil matrix around cobbled-sized and larger worked-stone and plaster "brick" inclusions. Covered the entire 2 x 2 m trench. Directly under topsoil.

Compact light grey-brown stratum below the architectural collapse [87001]. This locus covered the entire 2 x 2 m trench. First incidence in the trench of a unit with a significant amount of ceramic material. [87002] would have been the surface level onto which [87001] collapsed. Exposure accounts for the compaction.

Thick deposit of loose brown soil covering the entire 2x2m trench. The soil matrix has varying amounts of pisate throughout; the ceramic assemblage consists of large sherds, including 2 or 3 relatively complete vessels, represented in the large sherd material.

Smooth and soft brown soil matrix covering the entire 2x2 m trench. The matrix is similar to locus 87003, but the average size of the ceramic material is much smaller, and the Habubek brown is absent. Locus 87004 is the exposed surface onto which dump 87003 was deposited.
