For completeness of presentation, we first provide some useful technical lemmas and their proofs, and then give the proofs of the main theorems in this supplementary material. Since corollaries are direct results of corresponding theorems, their proofs are straightforward thus omitted.

1 Technical Lemmas

We first introduce some additional notation in counting processes. For the \(i\)th subject in the \(k\)th stratum, define the counting process \(N_{ki}(t) = 1(Y_{ki} \leq t, \delta_{ki} = 1)\). The corresponding intensity process \(A_{ki}(t; \beta) = \int_0^t 1(Y_{ki} \geq s) \exp(X_{ki}^T \beta) d\Lambda_0(k)(s)\), where \(\Lambda_0(k)(t) = \int_0^t \lambda_0(k)(s) ds\) is the baseline cumulative hazard function for the \(k\)th stratum, \(k = 1, \cdots, K, i = 1, \cdots, n_k\).

Let \(M_{ki}(t; \beta) = N_{ki}(t) - A_{ki}(t; \beta)\), then \(M_{ki}(t; \beta_0)\) is a martingale with respect to the filtration \(\mathcal{F}_{ki}(t) = \sigma\{N_{ki}(s), 1(Y_{ki} \geq s), X_{ki} : s \in (0, t]\}\).

Recall that the stratum-specific weighted covariate process \(\tilde{\eta}_k(t; \beta) = \tilde{\mu}_{1k}(t; \beta)/\tilde{\mu}_{0k}(t; \beta)\), where \(\tilde{\mu}_{rk}(t; \beta) = (1/n_k) \sum_{i=1}^{n_k} 1(Y_{ki} \geq t)X_{ki}^{\otimes r} \exp\{X_{ki}^T \beta\}\). Their population-level counterparts are \(\mu_{rk}(t; \beta) = E[1(Y_{k1} \geq t)X_{k1}^{\otimes r} \exp\{X_{k1}^T \beta\}]\) and \(\eta_{0k}(t; \beta) = \mu_{1k}(t; \beta)/\mu_{0k}(t; \beta)\), \(r = 0, 1, 2, k = 1, \cdots, K\). It is easily seen that the process \(\{X_{ki} - \tilde{\eta}_k(t; \beta_0)\}\) is predictable with respect to the filtration \(\mathcal{F}(t) = \sigma\{N_{ki}(s), 1(Y_{ki} \geq s), X_{ki} : s \in (0, t], k = 1, \cdots, K, i = 1, \cdots, n_k\}\).
Lemma S.1. Under Assumptions B.1–B.3, for $k = 1, \cdots, K$, we have
\[
\sup_{t \in [0, \tau]} |\hat{\mu}_{0k}(t; \beta^0) - \mu_{0k}(t; \beta^0)| = O_P(\sqrt{\log(p)/n_k}),
\]
\[
\sup_{t \in [0, \tau]} \|\hat{\mu}_{1k}(t; \beta^0) - \mu_{1k}(t; \beta^0)\| = O_P(\sqrt{\log(p)/n_k}),
\]
\[
\sup_{t \in [0, \tau]} \|\hat{\eta}_k(t; \beta^0) - \eta_{k0}(t; \beta^0)\| = O_P(\sqrt{\log(p)/n_k}).
\]

Lemma S.1 is simply the result of Lemma A1 in Xia et al. (2021) applied to each of the $K$ strata. We omit its proof here.

Lemma S.2. Assume $p^2 \log(p)/n_{\min} \to 0$. Under Assumptions B.1–B.5, for any $c \in \mathbb{R}^p$ such that $\|c\|_2 = 1$ and $\|c\|_1 \leq a_*$ with some absolute constant $a_* < \infty$, we have
\[
\frac{\sqrt{N} c^T \Theta_{\beta^0} \hat{\ell}(\beta^0)}{\sqrt{c^T \Theta_{\beta^0} c}} \overset{D}{\to} N(0, 1).
\]

Proof of Lemma S.2. We rewrite
\[
-\frac{\sqrt{N} c^T \Theta_{\beta^0} \hat{\ell}(\beta^0)}{\sqrt{c^T \Theta_{\beta^0} c}} = \frac{1}{\sqrt{N}} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \hat{\mu}_{0k}(Y_{ki}; \beta^0) \right\} \delta_{ki}
\]
\[
= \frac{1}{\sqrt{N}} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_0^T \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \hat{\mu}_{0k}(Y_{ki}; \beta^0) \hat{\mu}_{1k}(t; \beta^0) \right\} dN_{ki}(t)
\]
\[
= \frac{1}{\sqrt{N}} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_0^T \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \frac{\hat{\mu}_{1k}(t; \beta^0)}{\hat{\mu}_{0k}(t; \beta^0)} \right\} dM_{ki}(t). \tag{S.1}
\]

Denote $U(t) = \frac{1}{\sqrt{N}} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_0^t \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \frac{\hat{\mu}_{1k}(s; \beta^0)}{\hat{\mu}_{0k}(s; \beta^0)} \right\} dM_{ki}(s)$. Then the variation process for $U(t)$ is
\[
\langle U(t) \rangle = \sum_{k=1}^{K} \sum_{i=1}^{n_k} \frac{1}{N} \int_0^t \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \hat{\eta}_k(u; \beta^0) \right\} \beta^2 1(Y_{ki} \geq u) e^{X_{ki}^T \beta^0} d\Lambda_{0k}(u) \Theta_{\beta^0} c
\]
\[
= \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left[ \sum_{k=1}^{K} \frac{n_k}{N} \int_0^t \left\{ \frac{\hat{\mu}_{2k}(u; \beta^0) - \hat{\mu}_{1k}(u; \beta^0) \hat{\mu}_{1k}^T(u; \beta^0)}{\hat{\mu}_{0k}(u; \beta^0)} \right\} d\Lambda_{0k}(u) \right] \Theta_{\beta^0} c. \tag{S.2}
\]

By Assumption B.4, following the same lines in the proof of Lemma A2 in Xia et al. (2021),
we have
\[
\frac{c^T \Theta_{\beta^0}}{c^T \Theta_{\beta^0} c} \left[ \int_0^t \left\{ \frac{\mu_{2k}(u; \beta^0)}{\mu_{0k}(u; \beta^0)} - \frac{\hat{\mu}_{1k}(u; \beta^0)}{\hat{\mu}_{0k}(u; \beta^0)} \right\} d\Lambda_{0k}(u) \right] \Theta_{\beta^0} c
\rightarrow v_k(t; \beta).
\]

Since \( n_k/N \rightarrow r_k \), then \( \langle U \rangle(t) \rightarrow_P \sum_{k=1}^K r_k v_k(t; \beta) \).

For any \( \epsilon > 0 \), define \( G_{ki}(u) = \frac{1}{\sqrt{N}} \frac{c^T \Theta_{\beta^0}}{\sqrt{c^T \Theta_{\beta^0} c}} \left\{ X_{ki} - \frac{\hat{\mu}_{1k}(u; \beta^0)}{\hat{\mu}_{0k}(u; \beta^0)} \right\} \) and the truncated process \( U_\epsilon(t) = \sum_{k=1}^K \sum_{i=1}^{n_k} \int_0^t G_{ki}(u) 1(|G_{ki}(u)| > \epsilon) dM_{ki}(u) \). The variation process of \( U_\epsilon(t) \) is
\[
\langle U_\epsilon \rangle(t) = \sum_{k=1}^K \sum_{i=1}^{n_k} \int_0^t G_{ki}^2(u) 1(|G_{ki}(u)| > \epsilon) dA_{ki}(u),
\]
where \( dA_{ki}(u) = 1(Y_{ki} \geq u) e^{\lambda \frac{u}{\beta}} d\Lambda_{0k}(u) \). Since
\[
|\sqrt{N} G_{ki}(u)| \leq a_s \| \Theta_{\beta^0} \|_{1,2} M \lambda_{\min}^{-1/2} \Theta_{\beta^0} = O(\sqrt{p}),
\]
then \( 1(|G_{ki}(u)| > \epsilon) = 0 \) almost surely as \( p/N \rightarrow 0 \). So \( \langle U_\epsilon \rangle(t) \rightarrow_P 0 \). By the martingale central limit theorem, we obtain the desirable result.

\[\square\]

**Lemma S.3.** Under Assumptions B.1–B.5, for \( \lambda \propto \sqrt{\log(p)/n_{\min}} \), the lasso estimator \( \hat{\beta} \) satisfies
\[
\| \hat{\beta} - \beta^0 \|_1 = O_P(s_0 \lambda), \quad \frac{1}{N} \sum_{k=1}^K \sum_{i=1}^{n_k} |X_{ki}^T(\hat{\beta} - \beta^0)|^2 = O_P(s_0 \lambda^2).
\]

**Proof of Lemma S.3.** This result is from the proof in Kong and Nan (2014), with minor modifications as follows. An intermediate replacement for the negative log-likelihood in the \( k \)th stratum
\[
\ell^{(k)}(\beta) = -\frac{1}{n_k} \sum_{i=1}^{n_k} \left[ \beta^T X_{ki} - \log \left\{ \frac{1}{n_k} \sum_{j=1}^{n_k} 1(Y_{kj} \geq Y_{ki}) \exp(\beta^T X_{kj}) \right\} \right] \delta_{ki}
\]

3
can be defined as
\[
\tilde{\ell}^{(k)}(\beta) = -\frac{1}{n_k} \sum_{i=1}^{n_k} \{\beta^T X_{ki} - \log \mu_{0k}(Y_{ki}; \beta)\} \delta_{ki},
\]
which is a sum of \(n_k\) independent and identically distributed terms. The target parameter is
\[
\bar{\beta} = \arg \min_\beta E \left\{ \frac{1}{N} \sum_{k=1}^{K} \frac{n_k}{N} \tilde{\ell}^{(k)}(\beta) \right\}.
\]
Then the excess risk for any given \(\beta\) is
\[
\mathcal{E}(\beta) = E \left\{ \frac{1}{N} \sum_{k=1}^{K} \frac{n_k}{N} \tilde{\ell}^{(k)}(\beta) \right\} - E \left\{ \frac{1}{N} \sum_{k=1}^{K} \frac{n_k}{N} \tilde{\ell}^{(k)}(\bar{\beta}) \right\}.
\]
We refer remaining details to Kong and Nan (2014).

\[\square\]

**Lemma S.4.** Under Assumptions B.1–B.5, assume \(\lambda \asymp \sqrt{\log(p)/n_{\min}}\), then it holds with probability going to one that \(\|\Theta_{\beta_0} \hat{\Sigma} - I_p\|_\infty \leq \gamma\), with \(\gamma \asymp \|\Theta_{\beta_0}\|_{1,1} \{\max_{1 \leq k \leq K} |n_k/N - r_k| + s_0 \lambda\}\).

Lemma S.4 shows that when \(\gamma \asymp \|\Theta_{\beta_0}\|_{1,1} \{\max_{1 \leq k \leq K} |n_k/N - r_k| + s_0 \lambda\}\), the \(j\)th row, \(j = 1, \ldots, p\), of \(\Theta_{\beta_0}\) will be feasible in the constraint of the corresponding quadratic programming problem with probability going to one.

**Proof of Lemma S.4.** We first derive the rate for \(\|\hat{\Sigma} - \Sigma_{\beta_0}\|_\infty\). Note that
\[
\|\hat{\Sigma} - \Sigma_{\beta_0}\|_\infty \\
\leq \left\| \frac{1}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_0^\tau \left[ \{X_{ki} - \eta(t; \hat{\beta})\} \otimes^2 - \{X_{ki} - \eta(t; \beta^0)\} \otimes^2 \right] dN_{ki}(t) \right\|_\infty \\
+ \left\| \frac{1}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_0^\tau \{X_{ki} - \eta(t; \beta^0)\} \otimes^2 dN_{ki}(t) - \Sigma_{\beta_0}\right\|_\infty \\
\equiv a_{N1} + a_{N2}.
\]
Due to the boundness Assumption B.1,

\[
a_{N1} \leq \left\| \frac{1}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_{0}^{\tau} \{X_{ki} - \hat{\eta}_k(t; \hat{\beta})\} \{\eta_{k0}(t; \beta^0) - \hat{\eta}_k(t; \hat{\beta})\}^T dN_{ki}(t) \right\|_{\infty} + \left\| \frac{1}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_{0}^{\tau} \{\eta_{k0}(t; \beta^0) - \hat{\eta}_k(t; \hat{\beta})\} \{X_{ki} - \eta_{k0}(t; \beta^0)\}^T dN_{ki}(t) \right\|_{\infty} \\
\leq \frac{4M}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_{0}^{\tau} \|\eta_{k0}(t; \beta^0) - \hat{\eta}_k(t; \hat{\beta})\|_{\infty} dN_{ki}(t) \\
\leq \frac{4M}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_{0}^{\tau} \|\eta_{k0}(t; \beta^0) - \hat{\eta}_k(t; \beta^0)\|_{\infty} dN_{ki}(t) + \frac{4M}{N} \sum_{k=1}^{K} \sum_{i=1}^{n_k} \int_{0}^{\tau} \|\hat{\eta}_k(t; \beta^0) - \hat{\eta}_k(t; \hat{\beta})\|_{\infty} dN_{ki}(t) \\
\leq 4M \mathcal{O}_P(\sqrt{\log(p)/n_{min}}) + 4M \mathcal{O}_P(s_0 \lambda) = \mathcal{O}_P(s_0 \lambda),
\]

where the last inequality is a result of Lemma S.1 and the fact that \(\sup_{t \in [0, \tau]} \|\hat{\eta}_k(t; \beta^0) - \hat{\eta}_k(t; \hat{\beta})\|_{\infty} = \mathcal{O}_P(\|\hat{\beta} - \beta^0\|_1) = \mathcal{O}_P(s_0 \lambda)\) (see the proof of Lemma A4 in Xia et al. (2021)). Since \(\Sigma_{\beta^0} = \sum_{k=1}^{K} r_k \Sigma_{\beta^0,k} \),

\[
a_{N2} \leq \sum_{k=1}^{K} \frac{n_k}{N} \left[ \int_{0}^{\tau} \{X_{ki} - \eta_{k0}(t; \beta^0)\}^2 dN_{ki}(t) - \Sigma_{\beta^0,k} \right] \right\|_{\infty} + \left\| \sum_{k=1}^{K} \left( \frac{n_k}{N} - r_k \right) \Sigma_{\beta^0,k} \right\|_{\infty} \\
\leq \sum_{k=1}^{K} \frac{n_k}{N} \left[ \int_{0}^{\tau} \{X_{ki} - \eta_{k0}(t; \beta^0)\}^2 dN_{ki}(t) - \Sigma_{\beta^0,k} \right] \right\|_{\infty} + \sum_{k=1}^{K} \left( \frac{n_k}{N} - r_k \right) \Sigma_{\beta^0,k} \right\|_{\infty}.
\]

The proof of Lemma A4 in Xia et al. (2021) shows that, for \(k = 1, \cdots, K\),

\[
\left\| \frac{1}{n_k} \sum_{i=1}^{n_k} \int_{0}^{\tau} \{X_{ki} - \eta_{k0}(t; \beta^0)\}^2 dN_{ki}(t) - \Sigma_{\beta^0,k} \right\|_{\infty} = \mathcal{O}_P(\sqrt{\log(p)/n_k})
\]

by Hoeffding’s concentration inequality. So \(a_{N2} = \mathcal{O}_P(\sqrt{\log(p)/n_{min}}) + \mathcal{O}(\max_k |n_k/N - r_k|)\). Then, combining the bounds on \(a_{N1}\) and \(a_{N2}\), \(\|\Sigma - \Sigma_{\beta^0}\|_{\infty} = \mathcal{O}_P(s_0 \lambda + \max_k |n_k/N - r_k|)\).
Finally, it is easy to see that
\[
\|\Theta_{0\beta} \hat{\Sigma} - I_p\|_{\infty} = \|\Theta_{0\beta}(\hat{\Sigma} - \Sigma_{0\beta})\|_{\infty} \leq \|\Theta_{0\beta}\|_{1,1} \|\hat{\Sigma} - \Sigma_{0\beta}\|_{\infty},
\]
and \(\|\Theta_{0\beta} \hat{\Sigma} - I_p\|_{\infty} = O_P(\|\Theta_{0\beta}\|_{1,1}\{s_0\lambda + \max_k |n_k/N - r_k|\})\). \(\square\)

**Lemma S.5.** Under the assumptions in Lemma S.4, if we further assume for some constant \(\epsilon' \in (0, 1)\), \(\lim sup_{n_{\min} \to \infty} p\gamma \leq 1 - \epsilon'\), then we have \(\|\hat{\Theta} - \Theta_{0\beta}\|_{\infty} = O_P(\gamma \|\Theta_{0\beta}\|_{1,1})\).

The proof of Lemma S.5 follows that of Lemma A5 in Xia et al. (2021), thus is omitted.

**Lemma S.6.** Under Assumptions B.1–B.3 and B.5, for each \(t > 0\),
\[
P(\|\hat{\ell}(\beta^0)\|_{\infty} > t) \leq 2Kpe^{-n_{\min}t^2/(8M^2)}.
\]

**Proof of Lemma S.6.** Since \(\hat{\ell}(\beta^0) = \sum_{k=1}^{K} \frac{n_k}{N} \hat{\ell}^{(k)}(\beta^0)\), we have
\[
P(\|\hat{\ell}(\beta^0)\|_{\infty} > t) \leq P\left(\sum_{k=1}^{K} \frac{n_k}{N} \|\hat{\ell}^{(k)}(\beta^0)\|_{\infty} > t\right)
\leq \sum_{k=1}^{K} P\left(\|\hat{\ell}^{(k)}(\beta^0)\|_{\infty} > t\right)
\leq \sum_{k=1}^{K} 2p e^{-n_{k}t^2/(8M^2)}.
\]

Note that \(\|X_{ki} - \tilde{\eta}_k(t; \beta^0)\|_{\infty} \leq 2M\) holds uniformly for all \(k\) and \(i\). Then the last inequality is a direct result of Lemma 3.3(ii) in Huang et al. (2013) when applied to each of the \(K\) strata. \(\square\)

## 2 Proofs of Main Theorems

**Proof of Theorem 3.1.** Let \(\hat{\ell}_j(\beta)\) be the \(j\)th element of the derivative \(\hat{\ell}(\beta)\). By the mean value theorem, there exists \(\tilde{\beta}^{(j)}\) between \(\hat{\beta}\) and \(\beta^0\) such that \(\hat{\ell}_j(\hat{\beta}) - \hat{\ell}_j(\beta^0) = \frac{\partial \hat{\ell}_j(\beta)}{\partial \beta^T}\bigg|_{\beta = \tilde{\beta}^{(j)}} (\hat{\beta} - \beta^0)\). Denote the \(p \times p\) matrix \(D = \left(\frac{\partial \hat{\ell}_1(\beta)}{\partial \beta}\bigg|_{\beta = \hat{\beta}^{(1)}}, \ldots, \frac{\partial \hat{\ell}_p(\beta)}{\partial \beta}\bigg|_{\beta = \hat{\beta}^{(p)}}\right)^T\). By the definition of
the de-biased estimator \( \hat{b} \), we may decompose \( c^T(\hat{b} - \beta^0) \) as

\[
c^T(\hat{b} - \beta^0) = -c^T \Theta_{\beta^0} \ell(\beta^0) - c^T(\Theta - \Theta_{\beta^0}) \ell(\beta^0) - c^T(\hat{\Sigma} - I_p)(\hat{\beta} - \beta^0) + c^T \hat{\Theta}(\hat{\Sigma} - D)(\hat{\beta} - \beta^0)
\]

where \( (i) = -c^T(\hat{\Theta} - \Theta_{\beta^0}) \ell(\beta^0), (ii) = -c^T(\hat{\Theta} - I_p)(\hat{\beta} - \beta^0) \) and \( (iii) = c^T \hat{\Theta}(\hat{\Sigma} - D)(\hat{\beta} - \beta^0) \).

We first show \( \sqrt{N}(i) = o_p(1) \) and \( \sqrt{N}(ii) = o_p(1) \). By Lemma S.5 and Lemma S.6,

\[
|\sqrt{N}(i)| \leq \sqrt{N} \|c\|_1 \cdot \|\hat{\Theta} - \Theta_{\beta^0}\|_{\infty,\infty} \cdot \|\ell(\beta^0)\|_{\infty}
\]

\[
\leq \sqrt{N} a_1 \Theta_{\beta^0} \|p\|_{1,1} \Theta_{\beta^0} \|\ell(\beta^0)\|_{\infty}
\]

\[
= O_p(\|\Theta_{\beta^0}\|_{1,1} \sqrt{\log(p)})
\]

where the last equality is a direct result of the assumption that \( \|\Theta_{\beta^0}\|_{1,1} \{\max_k |n_k/N - r_k| + s_0\lambda\} \sqrt{\log(p)} \rightarrow 0 \) when \( \lambda \asymp \sqrt{\log(p)/n_{\min}} \). By Lemma S.3,

\[
|\sqrt{N}(ii)| \leq \sqrt{N} \|c\|_1 \|\hat{\Theta} - \Theta_{\beta^0}\|_{\infty} \|\hat{\beta} - \beta^0\|_{1}
\]

\[
\leq \sqrt{N} a_2 \|\hat{\Theta} - \Theta_{\beta^0}\|_{\infty} \|\hat{\beta} - \beta^0\|_{1}
\]

\[
= O_p(\sqrt{N} \gamma s_0 \lambda)
\]

We then show that \( \sqrt{N}(iii) = o_p(1) \). Note that \( \hat{\Sigma} - D = (\hat{\Sigma} - \Sigma_{\beta^0}) + (\Sigma_{\beta^0} - \ell(\beta^0)) + (\ell(\beta^0) - D) \). By the proof of Lemma S.4, we see that with \( \lambda \asymp \sqrt{\log(p)/n_{\min}} \),

\[
\|\hat{\Sigma} - \Sigma_{\beta^0}\|_{\infty} = O_p(s_0 \lambda + \max_k |n_k/N - r_k|)
\]

Based on the proof of Theorem 1 in Xia et al. (2021), for each stratum, \( \|\tilde{\ell}(\beta^0) - D(k)\|_{\infty} = O_p(\sqrt{\log(p)/n_k}) \), where \( D(k) = \left( \frac{\partial \ell(k)(\beta)}{\partial \beta} \bigg|_{\beta = \hat{\beta}(1)}, \ldots, \frac{\partial \ell(k)(\beta)}{\partial \beta} \bigg|_{\beta = \hat{\beta}(n)} \right)^T \). Since the overall negative log partial likelihood \( \ell(\beta) = \sum_{k=1}^{K} \frac{n_k}{N} \ell(k)(\beta) \), and \( D = \sum_{k=1}^{K} \frac{n_k}{N} D(k) \), then \( \|\tilde{\ell}(\beta^0) - D\|_{\infty} = O_p(\sqrt{\log(p)/n_{\min}}) \). Also, \( \|\Sigma_{\beta^0,k} - \ell(k)(\beta^0)\|_{\infty} = O_p(\sqrt{\log(p)/n_k}) \) by the proof of Theorem 1 in Xia et al. (2021).
Then
\[ \| \Sigma_{\beta_0} - \tilde{\ell}(\beta_0) \|_{\infty} \leq \left\| \sum_{k=1}^{K} n_k \Sigma_{\beta_0,k} - \sum_{k=1}^{K} \frac{n_k}{N} \Sigma_{\beta_0,k} \right\|_{\infty} + \left\| \sum_{k=1}^{K} \frac{n_k}{N} \Sigma_{\beta_0,k} - \sum_{k=1}^{K} \frac{n_k}{N} \bar{\ell}^{(k)}(\beta_0) \right\|_{\infty} \]
\[ \leq K \max_k (|n_k/N - r_k| \| \Sigma_{\beta_0,k} \|_{\infty}) + K O_P(\sqrt{\log(p)}/n_{\min}) \]
\[ = O_P(\max_k |n_k/N - r_k| + \sqrt{\log(p)}/n_{\min}). \]

Therefore, for \( \lambda \asymp \sqrt{\log(p)/n_{\min}} \), \( \| \hat{\Theta} - D \|_{\infty} = O_P(s_0 \lambda + \max_k |n_k/N - r_k|) \), and
\[ |\sqrt{N}(iii)| \leq \sqrt{N} \| c \|_1 \| \hat{\Theta} \|_{\infty,\infty} \| \hat{\Sigma} - D \|_{\infty,\infty} \| \hat{\beta} - \beta_0 \|_1 \]
\[ \leq O_P \left( \sqrt{N} \| \Theta_{\beta_0} \|_{1,1} (s_0 \lambda + \max_k |n_k/N - r_k|) \right) s_0 \lambda \]
\[ \leq O_P \left( \sqrt{N/n_{\min}} \| \Theta_{\beta_0} \|_{1,1} (s_0 \lambda + \max_k |n_k/N - r_k|) p \sqrt{\log(p)} \right) \]
\[ = o_P(1). \]

Finally, for the variance,
\[ |c^T (\hat{\Theta} - \Theta_{\beta_0}) c| \leq \| c \|_1^2 \| \hat{\Theta} - \Theta_{\beta_0} \|_{\infty} \]
\[ \leq a_1^2 O_P(\gamma \| \Theta_{\beta_0} \|_{1,1}) = o_P(1). \]

By Slutsky’s theorem and Lemma S.2, \( \sqrt{n} c^T (\hat{b} - \beta_0)/(c^T \hat{\Theta} c)^{1/2} \xrightarrow{D} N(0,1). \)

**Sketch proof of Theorem 3.4.** Theorem 3.4 can be easily proved using Cramér-Wold device. For any \( \omega \in \mathbb{R}^p \), since the dimension of \( \omega \) is a fixed integer, we can invoke Theorem 3.1 by taking \( c = J^T \omega \). Note that \( \| J^T \omega \|_1 \leq \| J^T \|_{1,1} \| \omega \|_1 = \| J \|_{\infty,\infty} \| \omega \|_1 = O(1). \)
