Buttons become way to quickly show effects of sea level rise at a national level visually.

Scroll Over highlights state of study in grey or some color; relationship within the contiguous states; clicking will zoom to state.
Same buttons as previous window show sea level rise at a more specific scale.

Clicking button will again zoom into another area, this time the area of interest - Miami.
Buttons now become more about displaying characteristics of sea level rise that are often ignored: -location of population/density -location of businesses -locations of value (where the money is) Maybe clicking a combination of buttons can create an overlay of multiple diagrams?

Map would become an overlay of GIS data for population locations, racial distributions, etc. to speculate on exactly what things and which parties potential sea level rise would directly affect.

Jump back buttons to potentially choose different states and different cities prone to sea level rise.
