Installing and Running the Google App Engine
On a Macintosh System

This document describes the installation of the Google App Engine Software Development Kit (SDK) on a Macintosh and running a simple “hello world” application.

The App Engine SDK allows you to run Google App Engine Applications on your local computer. It simulates the run-time environment of the Google App Engine infrastructure.

Download and Install

You can download the Google App Engine SDK by going to:

http://code.google.com/appengine/downloads.html

and downloading the appropriate install package.

</table>

Download the Mac OS X installer – it should automatically mount as a virtual drive.
Drag the GoogleAppEngineLauncher to the Applications folder on your hard drive. This will copy the Google App Engine and install it as an application on your system.

Once this is done – you can eject the virtual drive by pressing on the Eject button.

Navigate to the /Applications folder on your main disk, find the AppEngineLauncher icon and launch it. You may need to scroll to the bottom of your screen to see the App Engine icon.

Accept any dialog box that asks if it is “OK to launch”.

When the Engine launches for the first time, it asks if you want to make “Command Links”:

Press “OK” – this will allow us to run the App Engine from the command line later. You will have to type an administrator password to make the links.

At this point, you can actually close the App Engine Launcher – we will run the application from the Command Line Interface (Terminal) instead of using the Launcher user interface.

Making your First Application

Now you need to create a simple application. We could use the “+” option to have the launcher make us an application – but instead we will do it by hand to get a better sense of what is going on.

Make a folder for your Google App Engine applications. I am going to make the Folder on my Macintosh Desktop called “apps” – the path to this folder is:

/Users/csev/Desktop/apps

And then make a sub-folder in within apps called “ae-01-trivial” – the path to this folder would be:

/Users/csev/Desktop/apps/ae-01-trivial
Create a file called **app.yaml** in the **ae-01-trivial** folder with the following contents:

```yaml
application: ae-01-trivial
version: 1
runtime: python
api_version: 1

handlers:
- url: /.*
  script: index.py
```

**Note:** If you are looking at a PDF copy of this book, please do not copy and paste these lines into your text editor – you might end up with strange characters – simply type them into your editor.

Then create a file in the **ae-01-trivial** folder called **index.py** with three lines in it:

```python
print 'Content-Type: text/plain'
print ''
print 'Hello there Chuck'
```

Then create a file in the **ae-01-trivial** folder called **index.py** with three lines in it:

```python
print 'Content-Type: text/plain'
print ''
print 'Hello there Chuck'
```

Then start the **GoogleAppEngineLauncher** program that can be found under **Applications**. Use the **File -> Add Existing Application** command and navigate into the **apps** directory and select the **ae-01-trivial** folder. Once you have added the application, select it so that you can control the application using the launcher.
Once you have selected your application and press **Run**. After a few moments your application will start and the launcher will show a little green icon next to your application. Then press **Browse** to open a browser pointing at your application which is running at **http://localhost:8080/**

Paste **http://localhost:8080** into your browser and you should see your application as follows:

```
Hello there Chuck
```

Just for fun, edit the **index.py** to change the name “Chuck” to your own name and press Refresh in the browser to verify your updates.

**Watching the Log**

You can watch the internal log of the actions that the web server is performing when you are interacting with your application in the browser. Select your application in the Launcher and press the **Logs** button to bring up a log window:
Each time you press **Refresh** in your browser – you can see it retrieving the output with a **GET** request.

**Dealing With Errors**

With two files to edit, there are two general categories of errors that you may encounter. If you make a mistake on the **app.yaml** file, the App Engine will not start and your launcher will show a yellow icon near your application:

To get more detail on what is going wrong, take a look at the log for the application:
In this instance – the mistake is mis-indenting the last line in the **app.yaml** (line 8).

If you make a syntax error in the **index.py** file, a Python trace back error will appear in your browser.

![Syntax error in index.py](image.png)

The error you need to see is likely to be the last few lines of the output – in this case I made a Python syntax error on line one of our one-line application.

When you make a mistake in the **app.yaml** file – you must the fix the mistake and attempt to start the application again.

If you make a mistake in a file like **index.py**, you can simply fix the file and press refresh in your browser – there is no need to restart the server.

**Shutting Down the Server**

To shut down the server, use the Launcher, select your application and press the **Stop** button.
