The Bardi House was designed by Lina Bardi as a home for her and her husband, Pietro Bardi. Located in Morumbi, São Paulo, Brazil, the house was built on the remnants of the rain forest of Mata Atlântica. The exterior walls of the house are made up of sheer glass panels. This helps connect the house and its inhabitants with nature. The view of the vegetation and landscape also provides for a natural mural. This modern house is also a victim of the “Dom-Ino house” model being that it consists of two concrete slabs connected by a staircase.

The Longitudinal section cut shows the two levels of the house as well as the building/landscape relationship. The Bardi House is situated into a sloped landscape.
The building/landscape relationship provides for many beautiful views from the South side of the house. Two views in particular are (1) from the staircase connecting the ground floor to the first floor, and (2) from the first floor looking through large windows.

This photograph is one taken of Lina Bardi herself, looking out over the landscape from the view portrayed in the rendered diagram provided.

This photo is one taken of the staircase where one might stand to look out over the descending landscape.
